Fostering Fair Data Practices in Europe

# Clearing some of the highest FAIR hurdles: PIDs, Metadata, and Semantic Interoperability for Data Stewards and Service Providers

# Program

- Introduction: The FAIRsFAIR project - Jessica Parland-von Essen
- Implementing persistent identifiers - Jessica Parland-von Essen
- Semantic interoperability and Metadata - Rob Hooft
- Q&A

# FAIRsFAIR

Fostering Fair Data Practices in Europe

## The FAIRsFAIR Project

FAIRsFAIR "Fostering FAIR Data Practices in Europe" has received funding from the European Union's Horizon 2020 project call H2020-INFRAEOSC-2018-2020 Grant agreement 831558

# FAIRsFAIR in a nutshell

Call: H2020-INFRAEOSC-5c

Budget: 10 million euro

Length: 36 months

Starting date: March 1 2019

22 partners from 8 MS

6 core partners

# FAIRsFAIR partners

Data Archiving and Networked Services

UNIVERSITEIT VAN AMSTERDAM

Universidade do Minho

UK Research  
and Innovation

# Our objective

Help **survey the landscape of FAIR activities** in relation to EOSC and identify where dialogue and collaboration can be encouraged.

Create a **basis for harmonisation** efforts to bring together the various actors working in the **FAIR ecosystem** and build a **functioning EOSC** and **active community** around EOSC.

## DATA PRACTICES

- ◆ **Reports**
  - ◆ FAIR requirements for persistence and interoperability
  - ◆ Guidelines for ontology design and vocabulary interoperability
  - ◆ Basic framework for services enabling FAIR (including software)
- ◆ **Solutions for interoperability and machine accessibility for FAIR-aligned repositories**
- ◆ **Prototype for interoperability of repositories**
- ◆ **Workshops and hackathons: Recommendations for FAIR Semantics and Semantics in FAIR**

## DATA POLICY

- ◆ **Reports**
  - ◆ Recommendations on data policy and analysis of practice
  - ◆ Integration of meta-data catalogues
  - ◆ White paper on alignment and synchronisation around FAIR, Open Science and EOSC
- ◆ **Support programme for repositories to reach FAIR compliance**

## CERTIFICATION

- ◆ **European network of trustworthy repositories enabling FAIR data**
- ◆ **Support and guidance for certification of data repositories**
- ◆ **Tool to identify relevant trustworthy certified repositories**
- ◆ **Pilots to support the assessment of FAIR data in trustworthy repositories**

## TRAINING, EDUCATION AND SUPPORT

- ◆ **Reports**
  - ◆ FAIR data in European higher education
  - ◆ Training for researchers in FAIR data science and its impact
- ◆ **FAIR competence centres tailored to different communities**
  - ◆ Three annual schools in core data skills for researchers
  - ◆ Five instructor training (train-the-trainer) events
- ◆ **FAIR competence framework for higher education**
  - ◆ Three annual FAIR data education stakeholder workshops
- ◆ **FAIR competences adoption handbook for universities**
  - ◆ Three workshops on integrating FAIR data competences
  - ◆ Case studies on good practices in FAIR competences education

# MAIN OUTPUTS

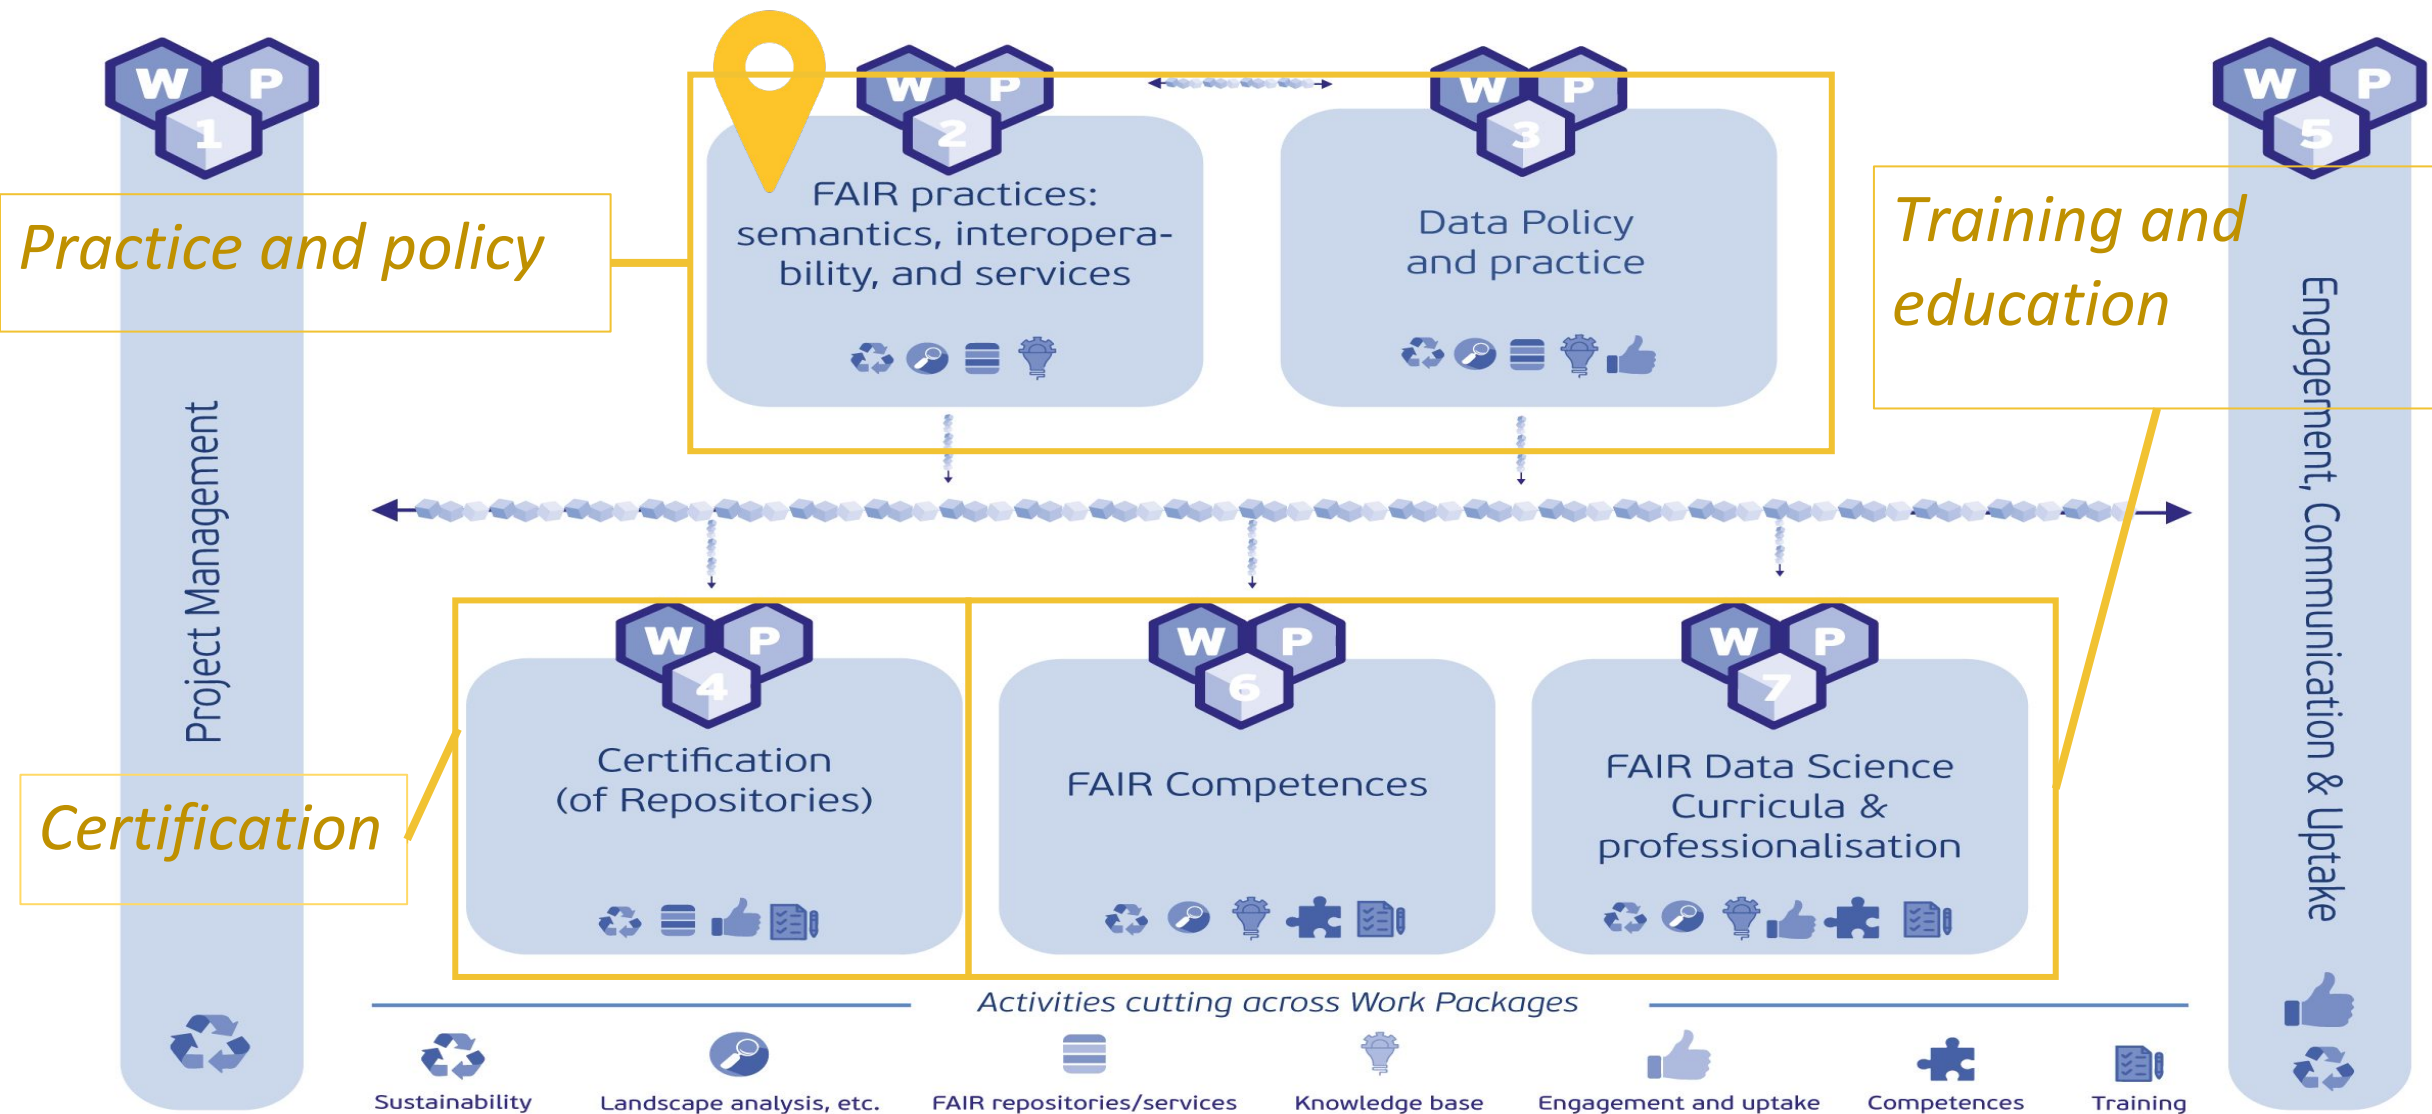

March 2019 - February 2022

# FAIRSFAR

Fostering Fair Data Practices in Europe

# WP2 FAIR Practices: Semantics, Interoperability and Services

- **November 2019:** D2.1 Report on FAIR requirements for persistence and interoperability 2019 (<https://doi.org/10.5281/zenodo.3557381>)
- **February 2020:** Assessment report on FAIRness of services (<https://doi.org/10.5281/zenodo.3688762>)
- **March 2020:** FAIR Semantics: First recommendations (<https://doi.org/10.5281/zenodo.3707985>)
- **August 2020:** 2nd Report on FAIR requirements for persistence and interoperability (<https://doi.org/10.5281/zenodo.4001631>)
- **October 2020:** M2.15 Assessment report on 'FAIRness of software' (<https://doi.org/10.5281/zenodo.4095092>)

Contact: Jessica Parland-von Essen [jessica.parland-vonessen@csc.fi](mailto:jessica.parland-vonessen@csc.fi)

## T2.1: Review of the technical implementation of FAIR principles

- The 1st Report was mainly a **landscaping exercise** which reviewed and documented the **state of FAIR** in the **European scientific data ecosystem**.
- The report identified commonalities and possible gaps in **semantic interoperability** and the use of **metadata and persistent identifiers** across infrastructures.
- The [2nd Report on FAIR requirements for persistence and interoperability](#) builds on the first report.
- It's been written specifically for **researchers, data stewards, and service providers**, and is a guide to the use of PIDs, metadata, and semantic interoperability.

# What part of FAIR is hard?

- Both FAIRsFAIR and the EOSC see that implementation of FAIR can be hard
- Some things are community-specific
- Some things are generic
  - PIDs
  - (semantic) interoperability
  - metadata

**FAIRsFAIR**  
Fostering Fair Data Practices in Europe

# Implementing Persistent identifiers

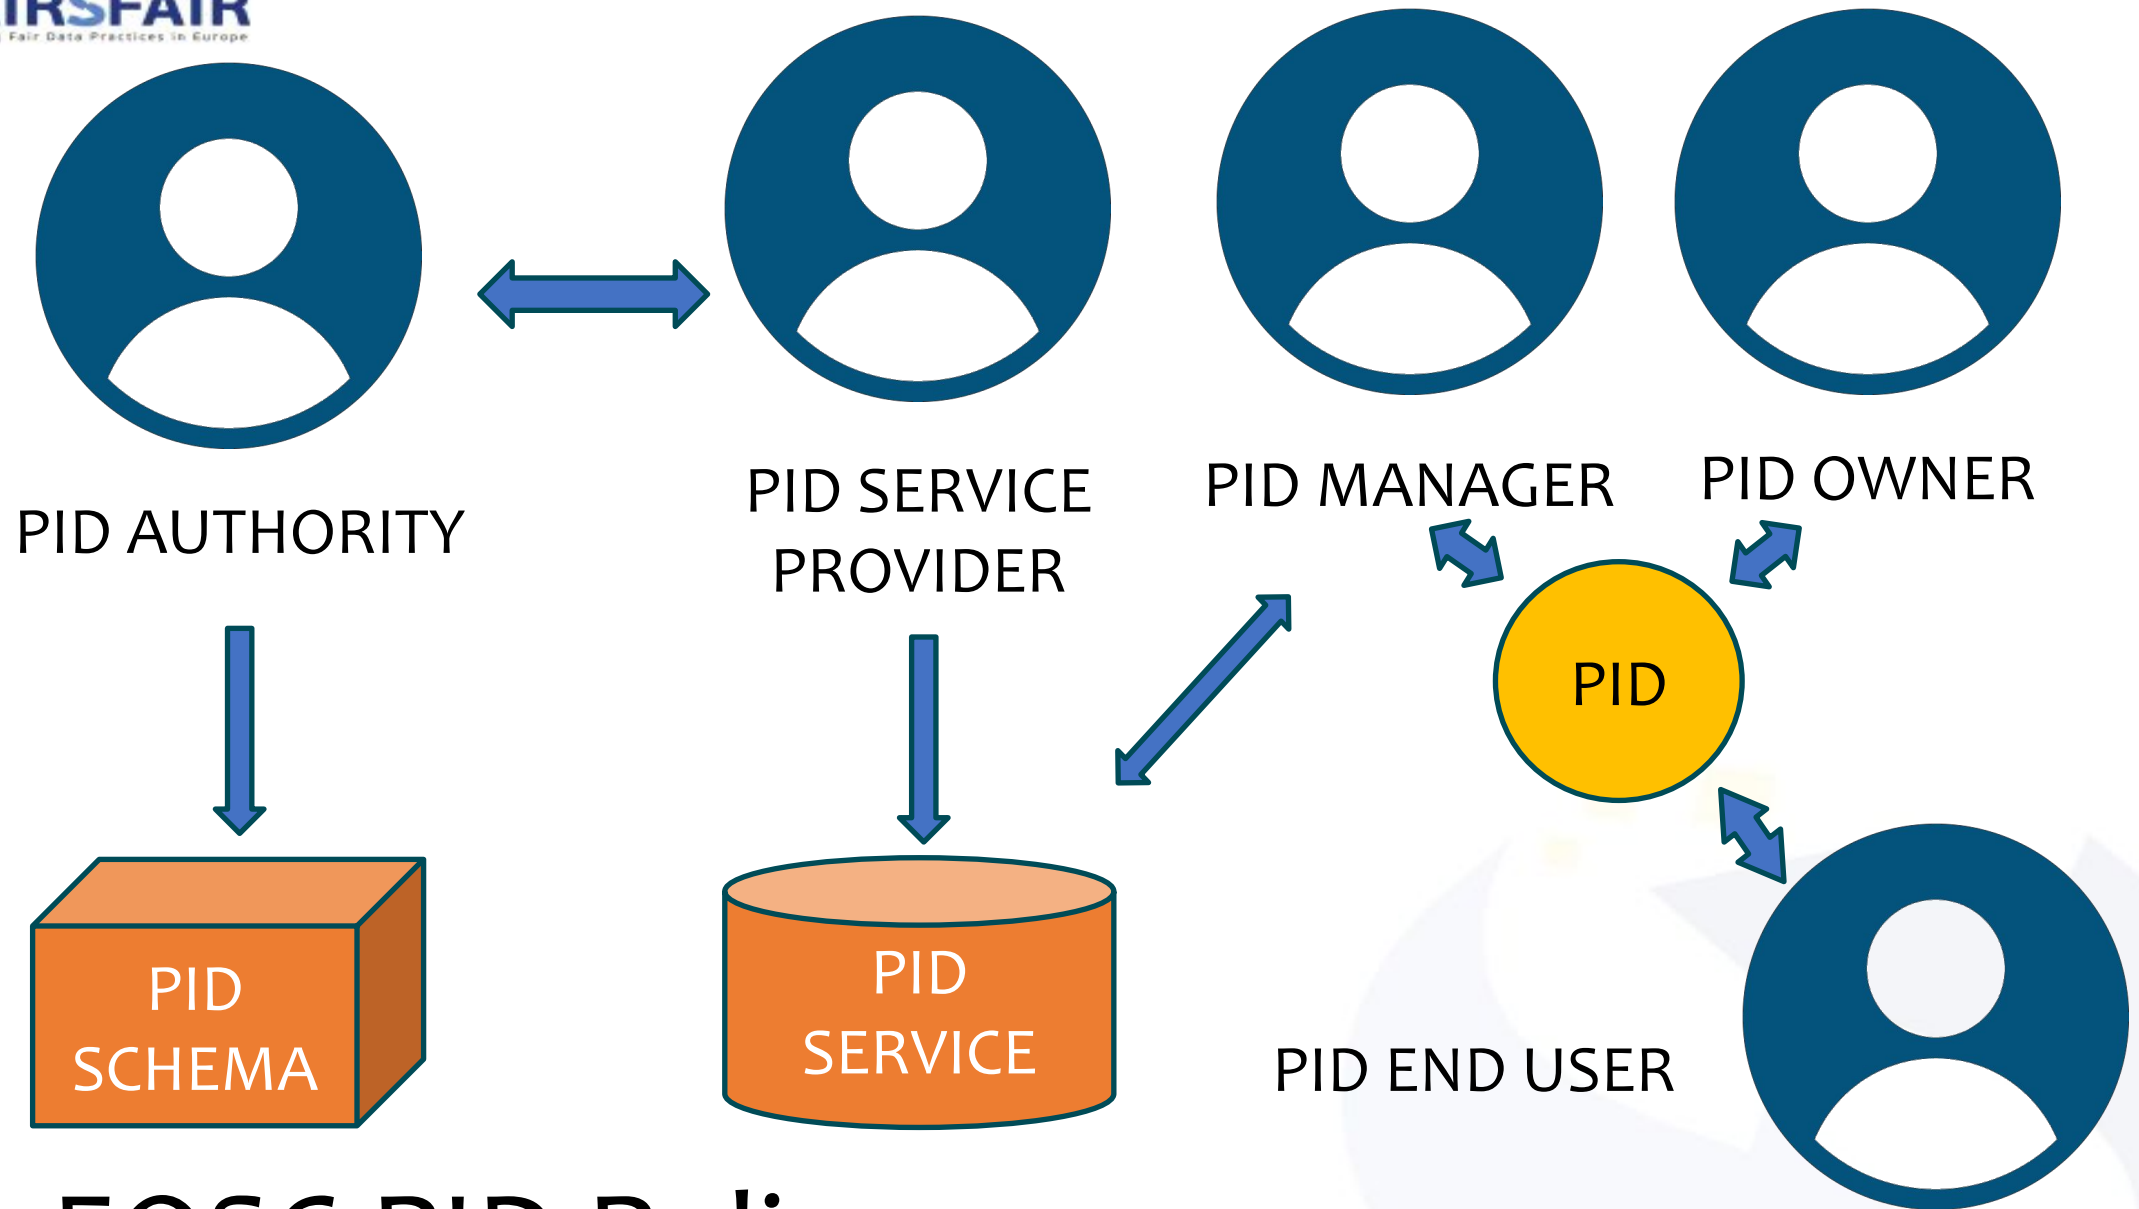

FAIRsFAIR "Fostering FAIR Data Practices in Europe" has received funding from the European Union's Horizon 2020 project call H2020-INFRAEOSC-2018-2020 Grant agreement 831558

# Persistent identifiers

- **Globally unique**, i.e. nobody else in the world should use the same string to refer to anything else
  - a controlled syntax and a governed namespace
  - be issued and managed by a clearly specified registration authority
- **Resolvable**, i.e. provide a way for both machines and humans to access the digital object itself, the state information and/or a landing page
- **Persistent**, i.e. remain unique and resolvable with a persistent syntax. The object it represents should also be persistent and protected against content drift
  - this requires metadata and curation

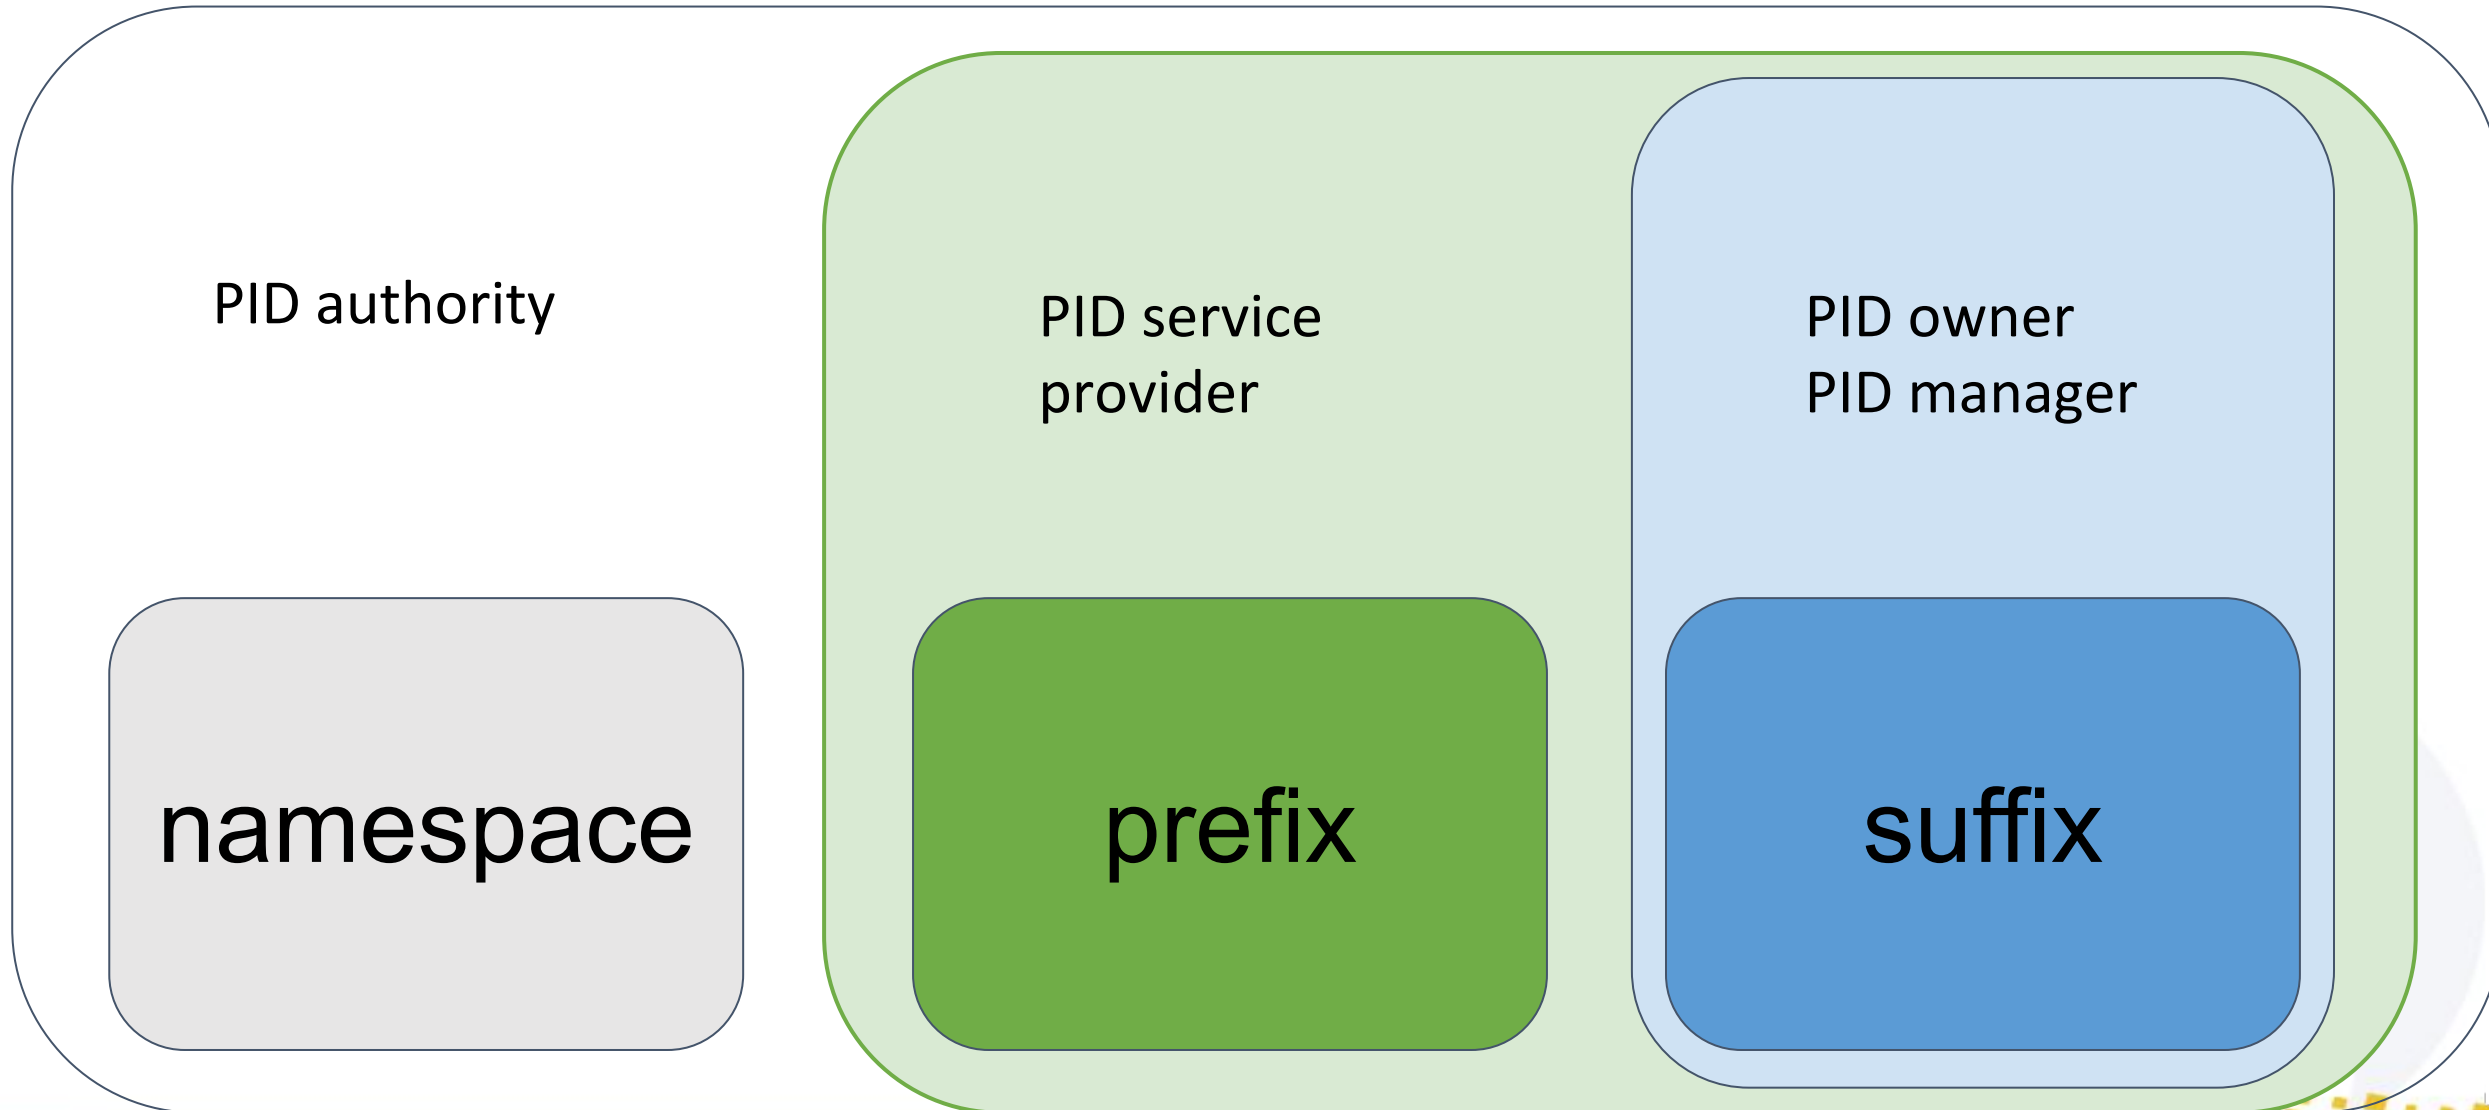

# EOSC PID Policy

<https://doi.org/10.5281/zenodo.3574202>

# Structure of PIDs and example responsibilities

# THE PROMISE

# THE COST

# Resolving

- **Domain Name Service (DNS) resolver:** Resolves a hostname to an IP address.
- **Local resolver**, e.g. load balancer, API gateway or web server: Redirects to a different host and/or path.
- **Full resolver**, e.g. handle system: Redirects to a URL either following a regular expression pattern, or a specific URL stored in the service.
- **Meta-resolver**, e.g. identifiers.org or n2t.net: Redirects to a URL following a regular expression pattern.
- **Single-service resolver:** some PIDs resolve to a single central resource, e.g. ORCID.

Source: Wimalaratne S, Fenner M D2.1 PID Resolution Services Best Practices. FREYA, 2018.

<https://doi.org/10.5281/zenodo.1324300>

## PID records and metadata

- The PID itself as a **string** contains information
  - the PID should be recognisable as a PID to the user (human and/or machine)
  - all other semantics poses a risk and should be carefully managed
- The PID contains **kernel metadata** that should be as minimal as possible
  - The PID record may be a non-authoritative source for arbitrary metadata and stored directly at the resolving service
- The **master metadata** is provided by the PID owner and manager

## Research information

## Research data

Ontology

Life cycle

Use cases

# Evolving datasets and citation

- Data Versioning: For retrieving earlier states of datasets, the data needs to be versioned. Markers shall indicate inserts, updates and deletes of data in the database.
- Data Timestamping: Ensure that operations on data are timestamped, i.e. any additions, deletions are marked with a timestamp.
- Data Identification: The data used shall be identified via a PID pointing to a time-stamped query, resolving to a landing page.

Rauber A, Asmi A, van Uytvanck D, Proell S. Data Citation of Evolving Data : Recommendations of the Working Group on Data Citation (WGDC). Published online October 20, 2015. <https://doi.org/doi:10.15497/RDA00016>

### 1. Landscape analysis

- Define objects to identify
- Identify relevant practices, standards and regulations
- Map external information systems and services
- Analyse the current state and the target state of your organisation

### 2. Comparing alternatives

- Assess the different PID systems and services for each object type
- Compare costs
- Plan for the life cycle
- Assess the trustworthiness of the solutions

### 3. Deployment and maintenance

- Create policies, guidelines and documentation
- Implement and offer training

## Service providers can support FAIR PIDs by

- providing and implementing a clear PID policy
- actively promoting and taking part in PID governance
- assigning and managing PIDs to master data and sharing these
- integrating external PIDs in their information architecture
- integrating external PIDs in the workflow of (meta)data creation
- automating the processes of metadata generation and linking as much as possible in user friendly, yet transparent ways

a PID  
is a promise

Fostering Fair Data Practices in Europe

## Semantic Interoperability

FAIRsFAIR "Fostering FAIR Data Practices in Europe" has received funding from the European Union's Horizon 2020 project call H2020-INFRAEOSC-2018-2020 Grant agreement 831558

## Interoperability Governance

- Four layers in the New European Interoperability Framework
- [https://ec.europa.eu/isa2/eif\\_en](https://ec.europa.eu/isa2/eif_en)

# Semantic Interoperability: Do I understand what you mean?

- If you don't know it, worth watching  
[https://www.youtube.com/watch?v=66oNv\\_DJuPc](https://www.youtube.com/watch?v=66oNv_DJuPc)

# Semantic Interoperability: File Format?

Does using “standard file formats” **solve** the interoperability problem?

- **No!**
- File format is “technical interoperability”
- **PDF** is standard, but no help for data reuse
- **CSV** doesn’t save the day
- **SPSS** doesn’t guarantee that data is understandable

So, what do we **need** in addition?

# Semantic Interoperability: Contents!

- All content needs to be unambiguous

<https://www.peterkrantz.com/2010/semantic-interoperability/>

# Semantic Interoperability: Contents!

- All terms need to be unambiguous
- All numbers need to be unambiguous

<https://www.slideshare.net/maximelefrancois86/reference-knowledge-models-for-smart-application>

# Semantic Interoperability: Contents!

- All terms need to be unambiguous
- All numbers need to be unambiguous
- What does it mean when data is missing/empty/"zero"/"-1"
- It should be impossible to misunderstand

# Misunderstanding?

- It should be impossible **for a user of the data** to misunderstand it

## Who is that user?

- You, right now?
- You, in 5 years?
- A coworker?
- Someone from a similar lab elsewhere?
- Someone performing wide-scale data integration?

<https://www.slideshare.net/maximelefrancois86/reference-knowledge-models-for-smart-application>

# Semantic interoperability: How?

- FAIR principles paper does not make a choice
- “Linked Data” is a very good technical implementation
  - Describe relationships and properties
  - Instead of terms, use “URIs” (or.... PIDs)
  - Very generic, many tools have been developed to work with it

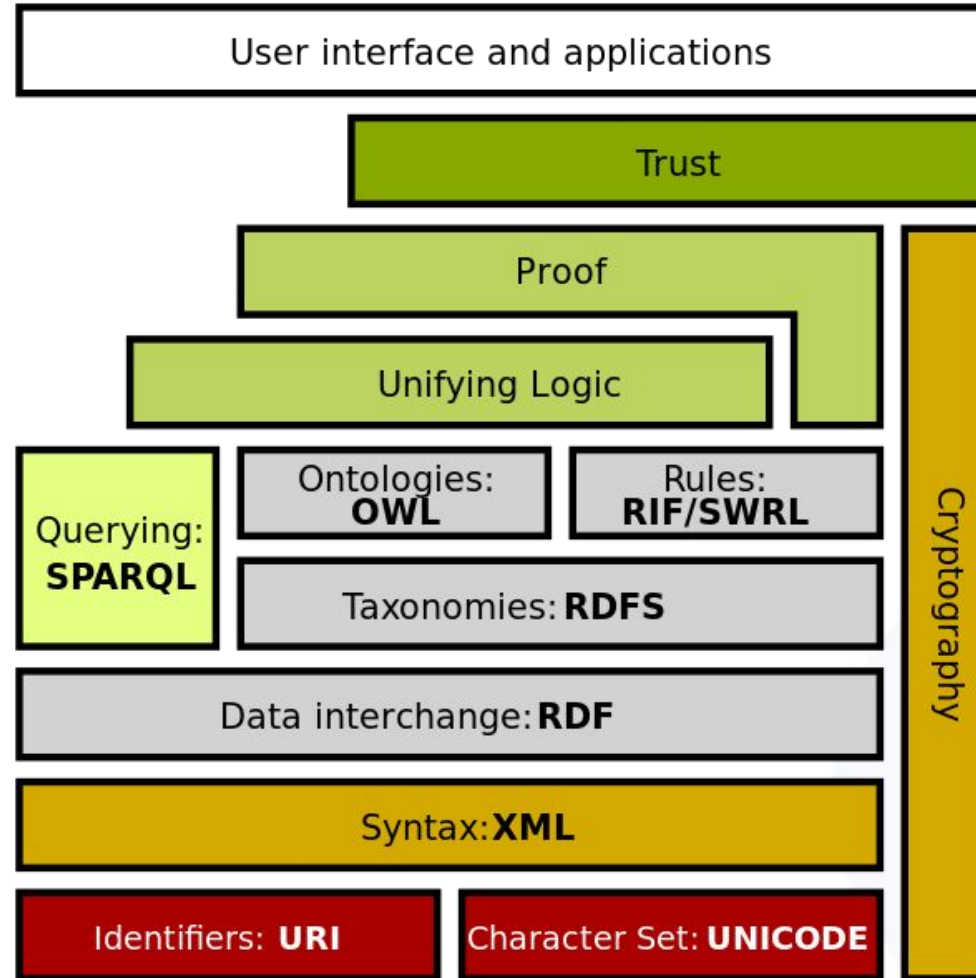

# Relationships and properties

# “Semantic Web” stack

# Data Structure

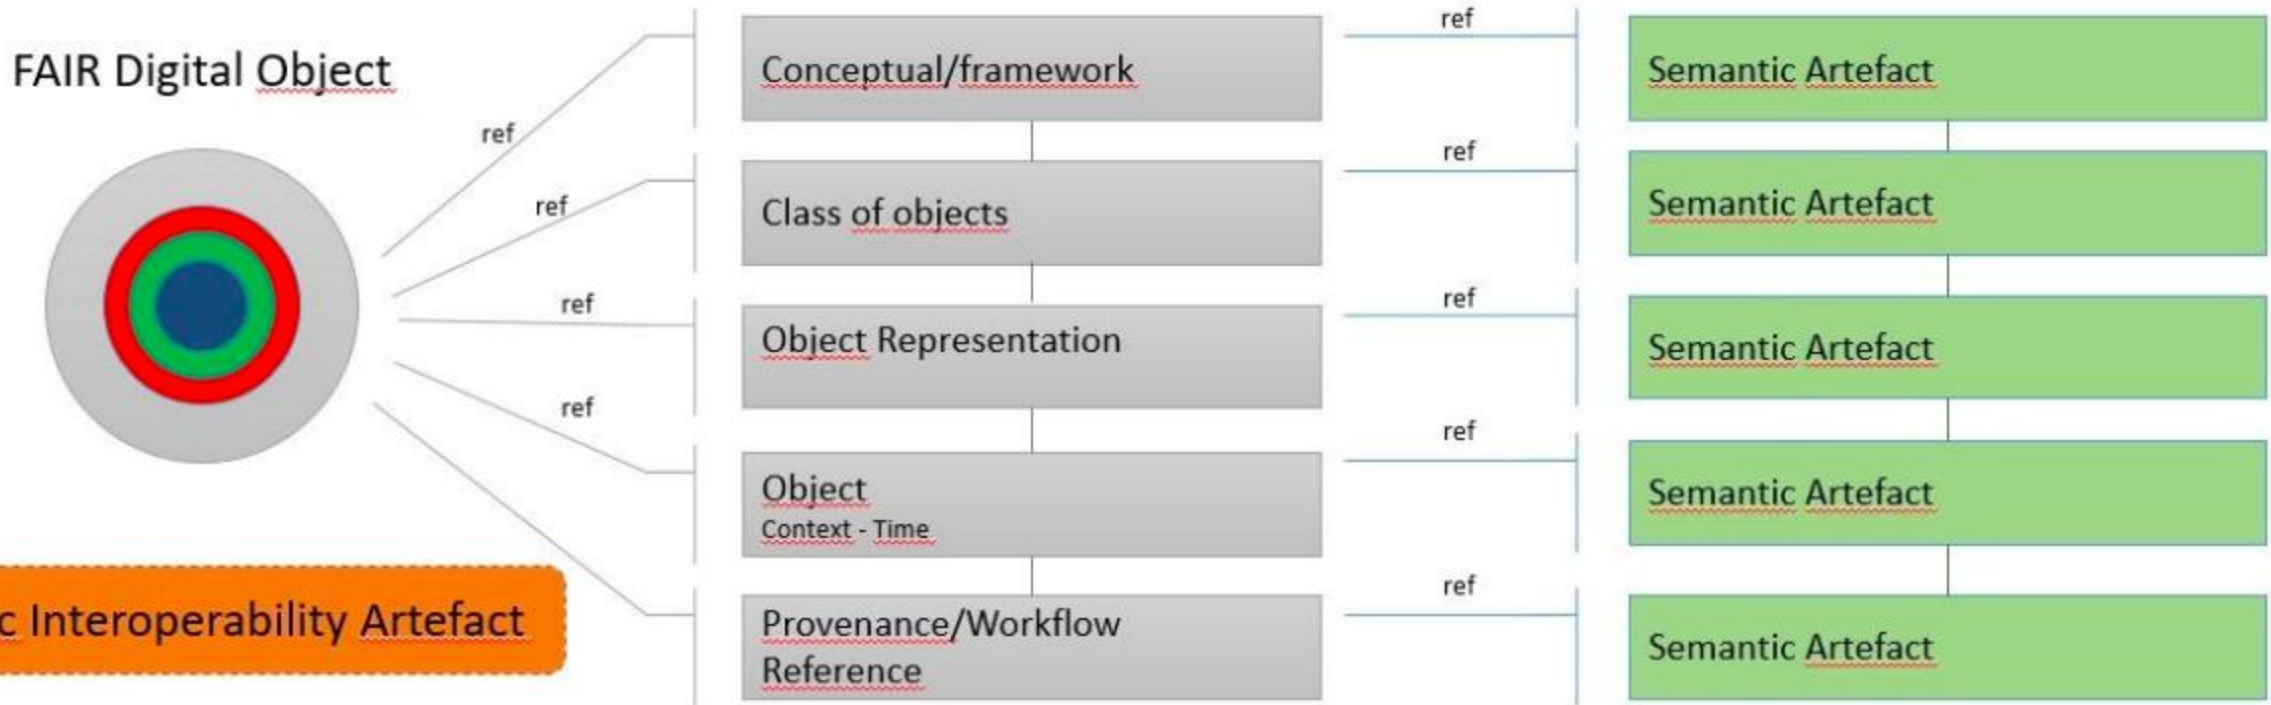

Unstructured data?

## RDF?

Please do not convert all data to RDF!  
But make sure it is unambiguously possible.

# Rich semantics also codes relations

The EOSC Interoperability Framework

<https://www.eoscsecretariat.eu/sites/default/files/eosc-interoperability-framework-v1.0.pdf>

# Semantic interoperability for machines

- Rather than using a term to describe something that is specific to a human language and may be context-dependent in practice, refer to concepts represented by a unique identifier
- Each data value should be associated with a precise data type, documented to such precision that misunderstandings are avoided
- Semantic artefacts are tools used for this
- Sharing and curating these to be FAIR and trustworthy is the basis for sustainable semantic interoperability
- Follow the recommendations for FAIR semantics (FAIRsFAIR D2.5)

## Service providers can support FAIR Interoperability by

- providing and implementing a clear data management policy
- actively promoting and taking part in developing common semantic artefacts and tools
- creating, curating and linking FAIR semantic artefacts and sharing these when possessing authoritative resources
- integrating external semantic artefacts in the information architecture
- integrating semantic artefacts in the workflow of (meta)data creation
- automating the processes of metadata generation using shared and controlled vocabularies

## Metadata

FAIRsFAIR "Fostering FAIR Data Practices in Europe" has received funding from the European Union's Horizon 2020 project call H2020-INFRAEOSC-2018-2020 Grant agreement 831558

“Don’t give me books for Christmas, I already have a book”

--- Jean Harlow

## Findable:

- F1. (meta)data** are assigned a globally unique and persistent identifier;
- F2.** data are described with rich metadata;
- F3. metadata** clearly and explicitly include the identifier of the data it describes;
- F4. (meta)data** are registered or indexed in a searchable resource;

## Interoperable:

- I1. (meta)data** use a formal, accessible, shared, and broadly applicable language for knowledge representation.
- I2. (meta)data** use vocabularies that follow FAIR principles;
- I3. (meta)data** include qualified references to other (meta)data;

## Accessible:

- A1. (meta)data** are retrievable by their identifier using a standardized communications protocol;
  - A1.1** the protocol is open, free, and universally implementable;
  - A1.2.** the protocol allows for an authentication and authorization procedure, where necessary;
- A2. metadata** are accessible, even when the data are no longer available;

## Reusable:

- R1. meta(data)** are richly described with a plurality of accurate and relevant attributes;
  - R1.1. (meta)data** are released with a clear and accessible data usage license;
  - R1.2. (meta)data** are associated with detailed provenance;
  - R1.3. (meta)data** meet domain-relevant community standards;

# DMP

“Which metadata standard(s) will you use”

With options:

- I will use Dublin Core
- I will use discipline specific standards

But: It should always be both!

## Findable:

**F1. (meta)data** are assigned a globally unique and persistent identifier;

**F2.** data are described with rich metadata;

**F3. metadata** clearly and explicitly include the identifier of the data it describes;

→ **F4. (meta)data** are registered or indexed in a searchable resource;

## Interoperable:

→ **I1. (meta)data** use a formal, accessible, shared, and broadly applicable language for knowledge representation.

→ **I2. (meta)data** use vocabularies that follow FAIR principles;

**I3. (meta)data** include qualified references to other (meta)data;

## Accessible:

**A1. (meta)data** are retrievable by their identifier using a standardized communications protocol;

**A1.1** the protocol is open, free, and universally implementable;

**A1.2.** the protocol allows for an authentication and authorization procedure, where necessary;

**A2. metadata** are accessible, even when the data are no longer available;

## Reusable:

→ **R1. meta(data)** are richly described with a plurality of accurate and relevant attributes;

→ **R1.1. (meta)data** are released with a clear and accessible data usage license;

→ **R1.2. (meta)data** are associated with detailed provenance;

→ **R1.3. (meta)data** meet domain-relevant community standards;

# What is in a metadata standard?

- Optional: Format
- Fields
  - Definition
  - Priority: Obligatory, Recommended, Optional
  - Ontology / Vocabulary

## How to find a metadata standard

- FAIRsharing
  - <http://fairsharing.org>
- RDA metadata directory
  - <http://rd-alliance.github.io/metadata-directory/>
- CEDAR:
  - <http://metadatacenter.org>
- Component MetaData Infrastructure, CDMI
  - <https://www.clarin.eu/content/component-metadata>

## Service providers can support metadata by

- providing and implementing a clear metadata policy
- actively promoting and taking part in developing common semantic artefacts and tools
- creating, curating and linking FAIR semantic artefacts and sharing these when possessing authoritative resources
- integrating semantic artefacts in the workflow of (meta)data creation
- automating the processes of metadata generation using shared and controlled vocabularies
